## **Research interests**

My expertise is based on the implementation of the sol-gel method for the synthesis of inorganic materials (glassy and crystalline) and organic-inorganic hybrid materials as coatings and membranes for various applications: electrolytes for Proton Exchange Membrane Fuel Cells (PEMFC), electrodes and electrolytes for Li-ion batteries, corrosion protection of metals and alloys, and oxidation protection at high temperature of carbon based ceramic composites. The characterization of processed material includes structural (FT-IR, UV-Vis, RBS, XPS, ToF-SIMS, etc.) and electrochemical characterization (CV, polarization, EIS, etc.).
